

Erzhan

GO BACKEND DEVELOPER

San Francisco, CA • Telegram: @yroshiku • Email: zzhusupoverzhan@gmail.com

Summary

Go backend engineer with 5 years of commercial experience building high-load microservice systems for U.S. products (B2B lead generation, healthcare, real estate). Strong with PostgreSQL, Kafka, Redis, gRPC, Docker and Kubernetes; design event-driven and distributed systems with a focus on performance, fault tolerance, idempotency and observability. Growing toward distributed-systems architecture and technical leadership.

Core Skills

Languages & API: Go (Golang), gRPC, REST API, net/http, gin, protobuf

Databases: PostgreSQL, Elasticsearch, Redis

Messaging & events: Apache Kafka, event-driven, exactly-once, outbox, saga

Infrastructure: Docker, Kubernetes, AWS (S3, SQS, ECS), GitLab CI/CD, Linux

Observability: OpenTelemetry, Jaeger, Prometheus, Grafana

Practices: microservice architecture, distributed systems, high-load, idempotency, circuit breaker, rate limiting, unit/integration testing, profiling, code review

Experience

Callbox Inc. — Go Backend Developer, Platform Engineering

2 years

Internal lead-processing platform: 50K leads/day, multi-channel prospecting.

Stack: Go, Kafka, Redis, PostgreSQL, net/http, gin, Prometheus, AWS ECS, GitLab CI/CD.

- Rewrote the lead-scoring service from Python to Go: p95 latency from 1.2s to 170ms, throughput from 600 to 8,000 leads/min per instance; lead conversion +12%.
- Built event-driven email-campaign tracking with exactly-once processing of 2M+ events/day: latency from 20s to 2s, duplicates from 0.3% to 0%, analytics queries 8 times faster.
- Designed and shipped a custom API gateway (Redis rate limiting, auth, circuit breaker): up to 2K RPS at p99 <5ms; auto-blocked a partner DDoS; partner onboarding from 2 weeks to 1 day.
- Implemented two-way CRM sync with Salesforce and HubSpot: sync latency from 1 day to 10 min, 0% duplicates, 15 clients onboarded in one quarter.
- Introduced distributed tracing (OpenTelemetry + Jaeger): shared library and instrumentation across 5 services, included trace propagation via Kafka — incident debugging from 30–60 min to 2–3 min.
- Optimized the audit-log pipeline for SOC 2 (Kafka -> Elasticsearch + S3): audit queries from 30s to <1s, -20% load on the primary DB; SOC 2 passed.

Glorium Technologies — Go Backend Developer

3 years

Telehealth platform for a clinic network (Z120K MAU) and a commercial real-estate aggregator.

Stack: Go, PostgreSQL, Kafka, Redis, Elasticsearch, S3, gRPC, Kong, Docker, Kubernetes, Prometheus, Grafana, Jaeger.

- Optimized the appointment-booking API: p95 from 850ms to 95ms, p99 from 2s to 180ms, 500 RPS with no degradation (optimistic locking, composite index, Redis cache-aside).
- Built a notification service (multi-channel SMS/push/email, outbox pattern, retry with backoff): no-shows from 18% to 7%, \$40K+/month saved, 15K notifications/day.
- Developed a HIPAA-compliant document service (S3 SSE-256, presigned URLs, ABAC, ClamAV scan): DB size from 40GB to 2GB, backup from 3 hours to 10 min.

- Added full-text doctor/slot search on Elasticsearch: from 800ms to 35ms, search -> booking conversion +15%.
- Contributed to the monolith-to-microservices migration (choreography saga over Kafka, protobuf contracts, compensating actions): scaling (40 -> 90 clinics).
- Real estate: built a listings-aggregation service across 6 MLS sources (incremental sync, rate limiting, circuit breaker): refresh from 6 hours to 5 min, 15× lower DB load, engagement +22%.

Education

2023 — Cassino university and Southern Lazio — Economics and Statistics.
